Uni App Security Notes

Notes for the Anwendungssicherheit (app security) course at HdM Stuttgart

Felicitas Pojtinger 2022-02-01

Please check out Jakob's notes for more detailed study materials!

Contributing

These study materials are heavily based on professor Heuzeroth's "Anwendungssicherheit" lecture at HdM Stuttgart.

Organization

Organization

- · 60 Minutes of test at the end
- · Will have practical examples
- · Threat detection plays a fundamental role in tests

Overview

Elements of a Secure Development Process

Primary purpose: Analysis of the data flow; data is both protected by the GDPR and represents value of the corportation

· Requirements

- · Security-Requirements
- · Anti-Requirements
- Abuse cases
- · Protection poker
- · → Security analysis/architecture analysis

Draft

- · AuthN/AuthZ
- Drafting concepts
- Risk modelling

Implementation

- Secure implementation guidelines
- · Code review, dynamic analysis
- Tests

Support Hierarchy

- · Level 1: Direct support with customers; call center, non-technical
- Level 2: People who know about typical problems with the software
- Level 3: Developers of the software

Basics

What is Secure Software?

- Software which is protected against intentional attacks
- Every participant in the software development process should be interested in this objective
- Software must be hardened against all known attacks (and future, unknown attacks)

What is Security?

- $\cdot Risk = \frac{Cost\ of\ breach}{Probability\ of\ breach}$
- A system is protected against threats compromising valuable data using measures which lead to a reduced, accepted risk.
- Accepted risk is defined by context of use (i.e. nuclear power: very low accepted risks)
- Safety: Protection of the environment from the functional effects a system
- · Security: Protection of the system from threats from the environment
- Concrete definitions: uni-itsec-notes#security-objectives; most importantly ("CIA objectives"):
 - · Confidentiality
 - Integrity
 - Availability
- If there are contractions between the security objectives (anonymity vs. accountability): The context defines which objectives dominate

CISSP Domains/Certificates

- · Security Engineering: Engineering and Management of Security
- Security Assessment and Testing: Designing, Performing and Analyzing Security Testing
- Security Operations: Foundational Concepts, Investigations, Incident Management and Disaster Recovery
- Software Development Security: Understanding, Applying and Enforcing Software Security
- $\cdot \rightarrow$ This course strives for 80% of TPSSE compliance

Why Security?

- Security is context dependent: On localhost and unprotected UNIX socket isn't an issue, but forward it with socat and it becomes a massive security vulnerability!
- With every change every test needs to be run again (regression testing)
- Typically ~30 errors in every 1000 lines of code
- Growing application complexity
- Devices are more and more connected which reduces the need for physical access
- · Extensible architectures

Common Terms

- Exploit/Proof of Concept
- Attack
- Vulnerability
- Threat
- Error
- 1. Threat agent gives rise to threat
- 2. Threat exploits vulnerability
- 3. Vulnerability leads to risk
- 4. Risk can damage asset and causes exposure
- 5. Exposure can be countermeasured by a safeguard
- 6. Safeguard directly affects threat agent

Threat Agents

- · Virus (i.e. infection)
- Hacker (i.e. unauthorized access)
- User (i.e. wrong config, data loss)
- Fire (i.e. damage to computers)
- · Worker (i.e. leaking)
- Other corporations (i.e. industrial espionage)
- Black hats (i.e. buffer overflows, DoS)
- · Intruders (i.e. physically stealing drives)

Researching Vulnerabilities

- · Classifying vulnerabilities by severity (low, middle, high)
- · Classifying vulnerabilities by exploit range (local or remote)
- Intents to find trends and attacks
- · Intents to find vulnerabilities before they can be exploited
- Intents to find countermeasures

CVSS Metrics

Results in a number which can be used to classify the vulnerability.

· Base Score Metrics

- · Exploitabilility Metrics
 - · AV: Attack Vector: Network, Adjacent Network, Local, Physical
 - AC: Attack Complexity: Low, High
 - · PR: Privileges Required: None, Low, High
 - · UI: User Interaction: None, Required
 - · S: Scope: Unchanged, Change
- · Impact Metrics (CIA Metrics)
 - · C: Confidentiality Impact: None, Low, High
 - · I: Integrity Impact: None, Low, High
 - · A: Availability Impact: None, Low, High

Temporal Score Metrics

- E: Exploit Code Maturity: Not defined, unproven that exploit exists, proof of concept code, functional exploit exists, high
- RL: Remediation Level: Not defined, official fix, temporary fix, workaround, unavailable

Balancing Security

- · Security is always a balance between functionality and usability
- \cdot Security often means to have restrictions in terms of features

Writing Secure Software

- · Many sections
 - Secure development practices
 - Secure development process (supply chain security)
 - · Security reviews
 - · Pentesting
- Time and money should be invested into all sections according to individual risk, not only into a singular section

Finishing Thoughts

- · Systems are only secure if all elements of the system are secure
- Perimeter and infrastructure security can not make the entire system secure
- · Applications are always connected
- · Development of secure systems is not a choice, but a must!

Web Application Security

Legal notes

- · Unauthorized breach of security systems is illegal
- · Unauthorized eavesdropping is illegal
- Distribution or usage of "hacking tools" is illegal (which has however been relativized by judges)

Components of Web Environments

- Web server (no business logic, static content)
- App server (business logic, Tomcat etc.)
- Databases
- Middleware
- · LDAP
- · Reverse Proxies
- · Web Application Firewalls
- · Load Balancers
- Firewalls

Targets

- Browser
- Transport
- · Web server
- · Web application
- Backend
- Network components
- · Partner connections (i.e. Sentry, Monitoring etc.)

Risks in the Layered Architecture

- · Client presentation layer: Validation
- · Browser: Browser sandboxing etc.
- Encryption in transport
- Server presentation layer: Input & output validation
- · Logging: Auditing
- · Error handling: Secure error escalation
- · All layers: Authorization & authentication checks
- Encryption to database
- Data protection in database

Methods to find Vulnerabilities

· Security audit

- Checks if previously established security guidelines have been implemented
- · Assessment of configuration

· Vulnerability assessment

- · Scans for known vulnerabilities
- · Can point in directions, but not show concrete exploits

Pentesting

- · Security audit and vulnerability assessment is included
- · Shows how vulnerabilities can be exploited

Pentesting Process

1. Pre-Attack Phase

- 1.1 Rules of engagement must be noted in a contract
- 1.2 Customer's requirements need to be queried
- 1.3 Enumeration
 - 1.3.1 Passive: Enumerating without having access to client's network
 - 1.3.2 Active: Scanning

2. Attack Phase:

- 2.1 Perimeter breach
- 2.2 Access
- 2.3 Exploit/privilege escalation
- 2.4 Keeping access
- 2.5 Removing all traces

3. Post-Attack Phase:

- 3.1 Restoring the pre-attack state
- 3.2 Writing the report
- 3.3 Posting recommendations on how to continue (i.e. fixing the vulnerabilities)
